******* INSTRUCTIONS *******

- Ensure that the program output matches the format specified in the assignment.
- Make sure to add clear screenshot of your program output corresponding to this assignment.
- All submitted work must be your own (or your group's) original work. Academic integrity policies apply.

Question: Create a Priority Queue

Gather all the required interfaces and classes (including the abstract classes) for implementation of the Priority Queue. Note that these Java source code files have been uploaded on the [Brightspace](#). Moreover, we studied about these required interfaces and classes during lecture.

After gathering the required interfaces and classes, complete the main method (given below) so that this method is able to (i) find and print the entry (both key and value) that has minimum key; (ii) print all the entries.

```
1 public class MainPriorityQueue{
2     public static void main(String[] args) {
3         UnsortedPriorityQueue<Integer, String> priorityQueue = new
4             UnsortedPriorityQueue<>();
5
6         // Insert elements into the priority queue
7         priorityQueue.insert(5, "A");
8         priorityQueue.insert(9, "C");
9         priorityQueue.insert(3, "B");
10
11         //*****Your code should come here*****
12     } //end main method
13 } end class
```

The output should look like this:

Output:

Minimum Key: 3, Value: B
Key: 3, Value: B

Key: 5, Value: A
Key: 9, Value: C
